## 1<sup>st</sup> ELEMENT OF CONSTRUCT;

THE LEARNER APPRECIATES CONTRIBUTION OF  
CHEMISTRY TO OUR ECONOMY.

Areas of emphasis;

- ① Manufacture of Oxygen
- ② Manufacture of Chlorine
- ③ Extraction of Metals  $\leftarrow \begin{matrix} Fe \\ Cu \\ Al \end{matrix}$
- ④ Manufacture of fertilizers
- ⑤ Manufacture of detergents
- ⑥ Manufacture of sodium hydroxide
- ⑦ Manufacture of sulphuric acid
- ⑧ Manufacture of cement
- ⑨ Manufacture of ethanol
- ⑩ Manufacture of Biogas.

Each Process;

V - vessel

Cp - chemical processes

cd - Conversion to  
desired product

Ch - Coherence

Pr - Purification

## Key points in assessment

- ⇒ Raw materials
- ⇒ Process of production.
- ⇒ Side effects of the process of production and mitigation
- ⇒ Social benefits

Do not  
write  
in this  
margin

LEARNER APPRECIATES CONTRIBUTION OF CHEMISTRY.  
TO OUR ECONOMY.

### ASSESSABLE AREAS.

1 and 2. MANUFACTURE OF CHLORINE; - Using Mercury Cathode Cell.  
OR SODIUM HYDROXIDE SOLUTION.

⇒ Raw materials; Concentrated sodium chloride solution, Mercury.  
(Brine)

⇒ Process of production;

Chlorine is manufactured by electrolysis of concentrated sodium chloride solution (Brine) using graphite<sup>as</sup> anode and mercury as cathode in a mercury cathode cell.

At Anode

Chloride and hydroxide ions migrate to the anode and chloride ions are preferentially discharged to form chlorine gas.

For NaOH; At Anode;  $\text{Na}^+ + \text{e}^- \rightarrow \text{Na}$  The sodium then mixes with mercury  
H.L.  $\rightarrow \text{Na/Hg}$

Sodium amalgam reacts with water forming sodium hydroxide solution.  
$$Na/Hg(l) + H_2O(l) \rightarrow NaOH(aq) + \frac{1}{2}H_2(g) + Hg(l)$$

### → Side effects of the process and mitigation.

- Suffocation due to release of other gases like hydrogen in confined spaces  
Proper Use of PPEs
- Exposure to high concentrations of chlorine leading to death  
Proper Use of PPEs or itching of eyes, noses
- Exposure to excessive noise from mechanical equipment/cylinders  
Proper Use of Personal Protective Equipment
- Exposure to mercury which is highly toxic and may cause damage to nervous system, reproductive system on long time-exposure.  
Proper Use of PPEs

### → Social benefits.

- Manufacturing plants are source of revenue to the Govt hence improved infrastructures.
- Employment opportunities hence improving the standards of living
- Chlorine in water is a disinfectant hence kills pathogens that would cause diseases to man.
- Chlorine is used in manufacture of a weed killers that reduce crop production.

- for NaOH
- used in manufacture of soap which is a detergent in homes.
  - Used in manufacture of drugs eg pain relievers - Eg Aspirin
  - Used in manufacture of baking powder
  - In paper making industry, it is used to clean the wood paper
  - Used in extraction of Aluminium.
  - In textile industry to make dyes,

## MANUFACTURE OF OXYGEN

⇒ Raw materials ; Air or (Atmospheric air)

⇒ Process of production

Atmospheric air is pumped into <sup>(V)</sup> tanks and the process involves the following stages.

### ① Filtration

Atmospheric air is filtered using air filters to remove dust particles.

### ② Drying.

(Ch) Air is cooled until the water vapour condenses. It is passed through a bed of silica gel. This is to remove water vapour.

### ③ Removal of pollutants.

The remaining air components are passed through beds of charcoal to remove air pollutants ( $\text{NO}_2$ ,  $\text{SO}_2$ ,  $\text{CO}$ , etc)

### ④ Removal of Carbon dioxide

It is then passed through concentrated potassium hydroxide solution to remove Carbon dioxide gas. (CP)

(C) Compression } Air is repeatedly compressed at high pressure of 200 atm and <sup>allowed to</sup> cooled at  $-200^\circ\text{C}$  to form liquid air. (CD)

(B) (P) Fractional distillation } The liquid air is pumped into fractionating column where nitrogen at with lowest boiling point ( $-196^\circ\text{C}$ ) comes off and later on <sup>further</sup> warming Oxygen is collected at  $-183^\circ\text{C}$

⇒ Side effects :- Noise pollution from compressors - <sup>proper</sup> Use of appropriate PPEs  
- Cold burning of oxygen cylinders

⇒ Social benefits :- ~~for air~~ - For breathing by sea divers, astronauts  
- Employment - salary - ~~improved~~ <sup>improved</sup> infrastructure - Manufacture of steel.  
- Used in ~~as~~ oxy-acetylene flames for cutting and welding of metals  
- Govt revenue - ~~improved~~ <sup>improved</sup> infrastructure.

## MANUFACTURE OF FERTILIZERS

### A. AMMONIUM FERTILIZERS

Urea ( $\text{H}_2\text{NCONH}_2$ )  
Ammonium nitrate  
Ammonium sulphate  
Ammonium phosphate  
Calcium Ammonium Nitrate (CAN)

⇒ Raw materials; Nitrogen gas, Hydrogen gas.

⇒ Process of production:

Nitrogen from fractional distillation of liquid air is reacted with hydrogen from natural gas in a ratio of 1:3 respectively to form ammonia by Haber process. The reaction requires low temperature (450-550), high pressure (200 atm) and finely divided Iron catalyst.

Ammonia produced is heated in air (oxygen) in presence of platinum catalyst forming nitrogen monoxide and water. All these in a tank.

Nitrogen monoxide is further oxidized to nitrogen dioxide

Nitrogen dioxide is dissolved in water in presence of oxygen, in a tank, forming nitric acid.

Urea; Obtained by reacting liquid ammonia gas with Carbon dioxide at high pressure (Cd)

Ammonium Nitrate; By reacting nitric acid with ammonia gas

Ammonium Sulphate;  $\text{NH}_3(\text{g}) + \text{H}_2\text{SO}_4(\text{l}) \rightarrow (\text{NH}_4)_2\text{SO}_4(\text{aq})$  (Cd)

The fertilizers are further concentrated and converted to solid form.

⇒ Side effects + Mitigation:

- Runoff into water bodies promoting <sup>increased</sup> algae growth thus oxygen supply is cut off leading to suffocation of aquatic animals
- Some when dissolved in water form acidic solution that alter soil pH hence low crop production

⇒ Social benefits:

- Source of employment as residents get salaries hence improved standards of living
- High levels of nutrients supplied <sup>leading</sup> by <sup>for</sup> to improved crop production hence better standards of living to farmers
- Some when dissolved in water form acidic solutions that alter soil pH, hence low crop prod

## MANUFACTURE OF SULPHURIC ACID

⇒ Raw materials ; - Sulphur dioxide gas.  
- Oxygen gas.

⇒ Process of production ;

Dry Sulphur dioxide free from impurities is heated with dry pure Oxygen gas at <sup>low</sup> temperature (of about 450-500°C), high pressure (of about 1-3 atmospheres) in presence of Vanadium(V) oxide Catalyst to form Sulphur trioxide. The reaction occurs in a Combustion cylinder.

(Cp) Sulphur trioxide is dissolved in ~~reacted~~ with little concentrated Sulphuric acid forming Oleum.

(Cd) Oleum is added to moderated <sup>volumes</sup> ~~amounts~~ of distilled water forming 98% concentrated Sulphuric acid.

⇒ Side effects and mitigation

- Toxic misty fumes from Oleum <sup>which</sup> ~~is~~ when inhaled may cause breathing problems and many side effects.
- Acid spills on the floor / Surfaces. leading to accidents

⇒ Social benefits

- Employment  $\equiv$  salaries  $\equiv$  improved standards of living
- Manufacture of fertilizer  $\equiv$  increased farm yields  $\equiv$  improved standards
- used in car batteries as electrolyte - - -

## MANUFACTURE OF CEMENT.

⇒ Raw materials; Limestone, clay, gypsum.

⇒ Process of production;

A mixture of Limestone and clay is crushed and milled into a fine powder.

The fine powder is then mixed with water and allowed to flow down a rotating drum (cylinder) in which it is strongly heated to about  $1500^{\circ}\text{C}$ .

Limestone decomposes to calcium oxide and carbon dioxide

(CP) Calcium oxide reacts with aluminium oxide and silicon dioxide in clay form lumps of calcium aluminate and calcium silicate

(PF) The lumps are crushed to form <sup>(Cd)</sup> cement as a fine powder. Gypsum is added during the grinding process to moderate the reaction between cement and water (setting of cement). Cement is packed in bags ready for use.

⇒ Side effects and mitigation

- Dust, noise during crushing
  - Poisonous fumes during crushing
  - Falling objects
  - Hot surface burns
  - Slips and falls during lifting, overloading
- } use of Appropriate PPE's

⇒ Social benefits.

- Employment opportunity to residents to improve their standard of living.
- Revenue to government of Uganda to increase improve on infrastructure

## MANUFACTURE OF ETHANOL

⇒ Raw materials; - Starch containing material eg Maize, Cassava, sweet  
or glucose  
millet, Sorghum, Potato

- Malt, Yeast.

⇒ Process of production:

The starch containing material is crushed and roasted (heated) to extract starch. Malt is then added to starch in a container and it is then covered. Malt contains an enzyme, diastase that catalyses hydrolysis of starch to maltose.

(CP) Yeast is then added to maltose after about 3 days at room temperature. Maltase in yeast catalyses the hydrolysis of maltose to glucose.

(Cd) Zymase enzyme in yeast catalyses the decomposition of glucose to <sup>crude</sup> ethanol and carbon dioxide.

Crude ethanol is converted to pure ethanol by fractional distillation. (Pr)

⇒ Side effects and mitigation

- Ethanol spills on surface leading to falls and accidents. PDE's
  - Hot surface burns during distillation. Appropriate
- (Add more points)

⇒ Social benefits:

- Employment opportunity, salary hence improved standards of living.
- Ethanol is used as a fuel in motor engines.
- As a solvent for some paints. ----- } build the point from there.
- Manufacture of drugs -----
- Manufacture of perfumes -----

## MANUFACTURE OF DETERGENTS

### (A) NON-SOAPY / SOAPLESS DETERGENTS

From an alcohol;

→ Raw materials; Duodecan-1-ol, Concentrated sulphuric acid  
1. Sodium hydroxide solution.

Process of production;

Duodecan-1-ol is reacted with cold concentrated sulphuric acid in a plastic container forming duodecyl hydrogen sulphate which is reacted with sodium hydroxide solution to form a detergent. This mixture can be added to minimum volumes of water to form liquid detergent. Some additives such as whitening agents, biological enzymes, fragrance, fillers, stabilizers may be added during the process.

Side effects and mitigation.

- Acid spills on surfaces
- Burns from acids when in contact with skin.
- 

Social benefits.

- Production of cleansing agents that one can use to clean surfaces to improve on hygiene hence improved health living.
- Employment  $\Rightarrow$  Salaries  $\Rightarrow$  Improved standards of living.

### (B) SOAPY DETERGENTS

→ Take them through Saponification

## MANUFACTURE OF BIO-GAS.

⇒ Raw materials; Organic waste, Water.

⇒ Process of production

Animal or plant (organic) wastes are put in a container and mixed with some little water.

(Cp) The container is covered to prevent aerial oxidation. The container and contents are maintained at a temperature between 25-30°C.

(Cd) Anaerobic bacteria breakdown the organic matter to finally methane, ammonia, hydrogen sulphide, Carbon dioxide and nitrogen gases.

⇒ Side effects and mitigation

- Fire outbreaks during leakage on pipes — By sealing off all pipes.
- Poisonous fumes in case of any leakage on pipes — Maintain taps closed.
- Proper use of PPE's

⇒ Social benefits

- Biogas is used for cooking and lighting since it is a renewable gas.
- Bio-slurry is used as an organic fertilizer and animal feeds to increase farmer's farm production hence better standards of living.

## EXTRACTION OF IRON

⇒ Raw materials: Ore (Haematite), Limestone, Coke.

⇒ Process of production:

The raw materials, i.e. haematite, limestone and coke are fed into a blast furnace.

Bottom part of furnace

Stage 1: Oxidation of coke.

Hot air from the bottom reacts with coke forming carbon dioxide gas. (oxidises)

Middle part of furnace

Stage 2: Reduction of Carbon dioxide

Carbon dioxide reacts with excess coke forming carbon monoxide

(Cp)

Stage 3: Reduction of Iron(III) oxide (haematite).

(Cd)

Carbon monoxide reduces haematite to molten iron and carbon dioxide

Role of limestone

Calcium carbonate decomposes to calcium oxide and carbon dioxide. The calcium oxide reacts with silicon dioxide and aluminum oxide impurities forming calcium silicate and calcium aluminate that are tapped off.

(Pr)

Purification: Pure iron (wrought iron) is obtained by passing air through molten iron to remove non-metal impurities.

⇒ Side effects + Mitigation

- Poisonous fumes

- Proper use of PPE

⇒ Social benefits

- Excessive noise from the plant

- Too much heat from furnace to workers

- Chemical spills on molten iron

## EXTRACTION OF COPPER.

⇒ Raw materials; Ore (Copper pyrites)  
Silicon dioxide

⇒ Production process;

① Concentrating the ore by froth flotation.

The ore is crushed and <sup>mixed</sup> with water containing a frothing agent such as palm oil in a container. Air is blown in the mixture to agitate as ore particles go to the surface <sup>with oil</sup> while impurities sink down with water. The froth is skimmed off and dilute sulphuric acid is added to break the froth. The froth is filtered off and dried.

② Roasting.

The dried ore is roasted in air in a <sup>blast</sup> furnace to form Copper(I) sulphide, Iron(II) oxide and Sulphur dioxide.

③ Smelting

<sup>double checked</sup> Silicon: The above resultant mixture is <sup>in absence</sup> of air <sup>extra</sup> all in a furnace to remove Iron(II) oxide.

④ Reduction;

The copper(I) sulphide is heated in controlled amount of air to form Impure copper. (c.d)

Purification; Impure Copper is purified by electrolysis using

(P) { Impure copper as anode and pure copper as cathode  
using acidified Copper(II) sulphate solution electrolyte

⇒ Side effects and Mitigation.

- Toxic fumes from production process can lead to <sup>Proper control of waste</sup> suffocation and death.
- Sulphur dioxide produced as a by-product reacts with water forming acidic rains that affect walls of houses.

⇒ Social benefit

- Employment opportunity - salary - Improved standards of living

## EXTRACTION OF ALUMINIUM:

⇒ Raw materials; Ore (Bauxite), Sodium hydroxide

⇒ Process of production;

### Concentrating the Ore

Bauxite is ground to powder and heated to convert any Iron(II) oxide impurity present to Iron(III) oxide and also to remove water of crystallisation.

The powder is then boiled with hot concentrated sodium hydroxide solution that dissolves the amphoteric aluminium oxide and acidic silicon dioxide.

(cp) In the ore-forming sodium aluminate and sodium silicate respectively. <sup>in a container</sup>

- The undissolved <sup>basic</sup> Iron(III) oxide and titanium(IV) oxide are filtered off.

- Carbon dioxide is bubbled through the filtrate to precipitate aluminium hydroxide leaving silicate ions in the solution.

(cd) Aluminium hydroxide is washed, dried and heated strongly to produce aluminium oxide.

### Electrolysis of aluminium oxide

Aluminium oxide is dissolved in molten cryolite to lower its melting point to 800°C. Electrolysis of molten aluminium oxide occurs using graphite electrodes in an Iron bath lined with graphite.

At Cathode;  $\text{Al}^{3+} + 3e \rightarrow \text{Al}(l)$

(At Anode  $2\text{O}^{2-} \rightarrow \text{O}_2(g) + 4e$ )

⇒ Side effects and mitigation

- Pollution from poisonous fumes - Proper use of PPEs

- Burns caused by contact with hot surfaces of - Proper use of PPE

⇒ Social benefits. - Chemical spills

- Employment opportunities to residents hence improved standard of living

- Source of revenue to government hence improved infrastructures
