UGANDA ADVANCED CERTIFICATE OF EDUCATION
INTERNAL EXAMINATION PROGRESS -, 2024
CHEMISTRY PAPER 1

(Principal Subject)

DURATION: 2 Hours 45 minutes

INSTRUCTIONS TO CANDIDATES:

- ✓ This paper consists of two sections A and B, Section A is compulsory and attempt only six questions from Section B. *Any additional question(s) answered will not be marked.*
- ✓ Incorrect symbols, formulae and spellings of especially technical terms will lead to loss of marks. And **good hand writing** is paramount please Boys.
- ✓ The periodic table, with relative atomic masses, is attached at the end of the paper.
- ✓ Illustrate your answers with equations where applicable, *Non-programmable scientific calculators may be used.*
- ✓ Assume where necessary, use the following values.

— Molar gas constant, R	=	8.314 JK ⁻¹ mol ⁻¹ .
— Molar volume of gas at s.t.p	=	22.4 litres.
— Standard temperature, T	=	273.15 K.
— Standard pressure, P	=	101325 Nm ⁻² .
— Molar volume of gas at r.t.p	=	24.0 litres.

This paper consists of 06 pages. You should check the question paper to ensure that all pages are printed as indicated and no questions are missing.

SECTION A-46 MARKS

ATTEMPT ALL QUESTIONS IN THIS SECTION.

- 1.(a) A solution containing 1.5% of a polymer was found to have an osmotic pressure of 3.6×10^{-4} atmospheres at room temperature. Calculate the molecular mass of the polymer.

(02½ marks)

$$1 \text{ atm} = 101,325 \text{ Pa}$$

$$3.6 \times 10^{-4} \text{ atm} = ?$$

$$\frac{1}{101,325} \times \frac{M_r}{\pi V} = \frac{M_r}{1.5 \times 0.0821 \times 298} \quad \left[\text{Since } 1.5\% = 1.5 \text{ g in } 100 \text{ cm}^3 \right]$$

$$\frac{3.6 \times 10^{-4} \text{ atm}}{1 \text{ atm}} \times 101,325 \text{ Pa}$$

$$M_r = 1,019,408.3 \text{ g.} \quad \checkmark$$

(Correct conversions award ½ m.c.)

$$(160 \text{ mmHg}(1 \text{ atm}))$$

$$\frac{M_r = mRT}{\pi V} = \frac{M_r = 1.5 \times 8.314 \times 298}{3.6 \times 10^{-4} \times 101,325 \times 100 \times 10^{-6}}$$

$$M_r = 1,018,822.3 \text{ g.} \quad \checkmark$$

Deduct ½ m.c. minus SI unit in the final answer.

- b) Explain why in the determination of molecular mass of polymers, osmotic pressure is used instead of ebullioscopic and cryoscopic methods.

(02 marks)

Polymers have high molecular masses; This therefore causes very small temperature change which is difficult to measure on Thermometer since colligative property (ies) is inversely proportional to the molar mass hence molar mass obtained will be higher than the true value.

02

Lucas reagent [Anhydrous Zinc chloride and conc. Hydrochloric acid].

A cloudy solution [White precipitate] $\text{at } 25^\circ\text{C}$ within 5 mins with $\text{CH}_3(\text{CH}_2)_2\text{CH}(\text{OH})\text{CH}_3$.

2. Name one reagent that can be used to distinguish between each of the following pairs of compounds. In each case, state what is observed if the reagent is separately treated with each member of the pair.

a) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}(\text{OH})\text{CH}_3$ & $\text{CH}_3\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{CH}_3$ (03 marks)

With $\text{CH}_3\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{CH}_3$ Reagent:

Iodine solution in sodium hydroxide solution. ✓

Reject:

Accept: Iodoform test. 03

- $\text{H}^+/\text{CrO}_4^{2-}$

Observation (s):

Yellow precipitate with $\text{CH}_3(\text{CH}_2)_2\text{CH}(\text{OH})\text{CH}_3$.

- PCl_3 or PCl_5

No observable change with $\text{CH}_3\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{CH}_3$.

- CH_3COCl .

- $\text{H}^+/\text{CrO}_4^{2-}$

b) 2-phenyl-2-methylpropan-2-ol & 3-phenylpropan-1-ol (03 marks)

Reagent:

Lucas reagent [Anhydrous Zinc chloride + conc. HCl acid]. ✓

Observation (s):

Accept: [White ppt]

Cloudy solution is formed within 0-5 mins with $\text{C}_6\text{H}_5\text{C}(\text{CH}_3)\text{CH}_2\text{OH}$ at 25°C .
No cloudy solution is formed at room temperature unless when heated.

3.(a) Thorium, ${}_{90}^{232}\text{Th}$ undergoes radioactive decay to give element, X according to the following equation below:

Calculate:

i. The atomic number of element, ${}^a_b\text{X}$.

$$90 = b + 2 \Leftrightarrow b = 90 - 2 \Leftrightarrow b = 88. \quad {}_{88}^a\text{X}. \quad (01 \text{ mark})$$

ii. The mass number of element, X.
 $232 = a + 4 \rightarrow a = 232 - 4 \rightarrow a = 228$, X^{228} . (01 mark)

b) Element, X decays further to form element, Y as shown below in the equation:

Calculate:

i. The atomic number of element, Y.
 $88 = b - 1 \rightarrow b = 88 + 1 \rightarrow b = 89$, Y^{89} . (01 mark)

ii. The mass number of element, Y.
 $228 = a + 0 \rightarrow a = 228 - 0 \rightarrow a = 228$, Y^{228} . (01 mark)

c) A radioactive isotope of element, X had an initial activity of 250 counts per second on a Geiger counter. After 40 minutes, the activity had declined to 240 counts per second. Calculate the half-life of element, X. (03 marks)

Data:

Initial activity, $A_0 = 250$ counts/s.

Final activity, $A_t = 240$ counts/s.

Time taken to decline = 40 mins.

∴

$$\ln\left[\frac{A_0}{A_t}\right] = \lambda t \rightarrow \ln\left[\frac{250}{240}\right] = \lambda \times 40 \rightarrow \lambda = 1.021 \times 10^{-3}$$

$$\frac{t_{1/2}}{\lambda} = \frac{\ln 2}{1.020549863 \times 10^{-3}} \Rightarrow t_{1/2} = 679.2 \text{ mins.}$$

[Don't write mm in its final answer]

4.(a) Define the term hydration energy. (01 mark)

Hydration energy is the heat evolved when one mole of gaseous ions dissolves in water to form an infinitely dilute solution.

OR [Insist on mode or given out]

Solvation energy is the enthalpy change when one mole of a gaseous ion is surrounded by water molecules to form an infinite dilute solution.

b) State two factors which affect the magnitude of hydration

energy.

(03 marks)

01

Ionic radius ✓

Ionic charge. ✓ Charge on the ion

c) The table below shows enthalpies of hydration of Ca^{2+} & Cl^- ions.

Ions	Enthalpy of hydration [kJ/mol]
Ca^{2+}	1,577
Cl^-	381

i. State whether the values of enthalpies of hydration of Ca^{2+} & Cl^- given in the table above are positive or negative. Give a reason for your answer.

The values of hydration given are negatives. \checkmark (01½ marks)

heat is released or given out when gaseous ions are surrounded by water molecules. 01½

ii. Calculate the enthalpy of hydration of calcium chloride.

$$\begin{aligned}\text{Hydration energy of } \text{CaCl}_2, \Delta H_h &= \Delta H_{h,\text{Ca}^{2+}} + 2\Delta H_{h,\text{Cl}^-} \\ &= -1,577 + 2(-381) \\ &= -1,577 - 762\end{aligned}$$

$$\text{Reject: } - \text{ or } -, \text{ kJ/mol. } = -2,339 \text{ kJ/mol. } \checkmark$$

5. The table below shows the first ionization energies and melting points of some group (II) elements of the periodic table. Use the information in it to answer the followings questions.

Elements	Mg	Ca	Sr	Ba
1 st Ionization energy [kJ/mol]	738	590	549	505
Melting points [$^{\circ}\text{C}$]	649	839	769	729

Briefly explain the variation in trends of:

- a) First ionization energy. (02½ marks)
- Ionization energy decreases from magnesium to barium due to increases in nuclear charge, and shielding effect because an extra shell are completely filled with electrons added as increase in screening effect outweighs that of nuclear charge. Effective nuclear charge decreases as atomic radius increases hence outermost electrons are far away and weakly attracted by the nucleus's atom, requiring low amount of energy to detach removed the most loosely held electron (02½ marks)
- b) Melting points. (02½ marks)
- Melting points increases from magnesium to calcium then reduces to barium. From magnesium to barium, their atomic radius and bond length increases as bond strength reduces hence decreasing the amount of energy needed to break the metallic bonds. Magnesium bear lower melting point than calcium because magnesium has hexagonal close-packed structure as calcium centred-cubic or open packed structure.

6. Complete the following equations and write a mechanism for the reaction in each case.

Mech:

- 7.(a) State what would be observed and write equation for the reaction that would take place when:

- i. Potassium iodide was added to acidified potassium dichromate solution. (02½ marks)

Observation (s):

Orange solution turns to green solution and a brown solution is evolved.

02½

Equation:

ii. Sodium thiosulphate was added to the mixture in a (i) above.
(02½ marks)

Observation (s):

Brown solution turns to colourless ✓

02½

Equation:

8. Name the reagent(s) and condition(s) that can be used to effect the following changes.

(01 mark)

Reagent (s): Ethanoyl bromide or chloride. ✓

01

Accept: Acid anhydride is $\text{CH}_3\text{COO}-\overset{\text{o}}{\underset{\text{C}}{\text{C}}}-\text{CH}_3$

Condition (s): Anhydrous Iron (III) Chloride, Anhydrous aluminium (III) bromide / Iron (III) bromide catalyst at a temperature refluxed on a water bath at a temperature of 50°C.

(01 mark)

Reagent (s): Bromine gas. ✓

Condition(s): Presence of ultra-light ✓
OR
Direct sunlight ✓

(01 mark)

Reagent (s): Chlorine gas ✓

01

Condition(s): Anhydrous iron (III) chloride catalyst ✓ at room temperature. Accept: Iron in present of heat

- 9.(a) Draw the structures and name the shape of the following oxides.
In each case state the oxidation state of sulphur atom.

(03 marks)

Oxide (s)	Structure	Shape	Oxidation state of sulphur
SO_2		V-shape OR ✓ Bent shape Reject: shaped	+4 ✓ Reject: 4 +4 or +4
SO_3		Trigonal Planar shape	+6 ✓ Reject: 6 +6 or +6.

Page | 8

b)(i) Name the reagent that can be used to distinguish the oxides

Accept:

in (a). Acidified potassium dichromate (VI) solution (01 mark)

Acidified potassium permanganate solution ✓ 01

ii. State what would be observed if each oxide is separately treated with the reagent you have named in b (i) above.

Purple solution turns colourless with SO_2 . ✓ 01

No observable change occurs with SO_3 . ✓ 01

Accept:

Orange solution turns green solution with SO_2 . ✓

No observable change occurs with SO_3 . ✓

iii. Write equation(s) for the reaction(s) that would take place when each oxide is separately treated with reagent you have named b (i).

(01½ marks)

OR

SECTION B-54 MARKS

ATTEMPT ANY SIX QUESTIONS IN THIS SECTION.

10.(a) Write an equation of reaction between water and the oxides of:

(@01½ marks)

i. Sodium.

Award ANY

Correct.

03

ii. Magnesium.

iii. Phosphorous.

b) Write equation for the reaction between concentrated sulphuric acid and:

i. Magnesium.

ii. Hydrogen bromide.

iii. Phosphorous.

11. The phase diagram for a mixture of metals P & Q is shown below.

a) Identify the regions A, B, C & D.

(02 marks)

- A: Solid P and liquid. ✗
- B: Liquid mixture or Solution. ✗ 02
- C: Solid P and solid Q. or Solid mixture. ✗
- D: Solid Q and liquid. ✗

b) State what point M represent. (01 mark)

Eutectic mixture.

c) Using the diagram, estimate the melting point of: (01 mark)

P: $410^\circ\text{C} \pm 2^\circ\text{C}$. ✗

Q: $325^\circ\text{C} \pm 2^\circ\text{C}$. ✗ 01

d) Describe what would happen if a mixture containing 50% by mass of P and Q is cooled from 410°C to 270°C . (03 marks)

The mixture cools to 270°C without change in phase. At 270°C , Metal P begins to solidify [Crystallise] as the composition of pure metal Q increases in the liquid mixture. The freezing-point decreases up to eutectic point temperature as further cooling is done.

At the eutectic point, the temperature and composition remains constant until the whole system crystallises or solidify hence the mixture cools with no change in phase up to 270°C . 03

e) State one each difference and similarity between the substance at point M and a pure compound. (@01 mark)

i. Difference:

Eutectic mixtures are heterogeneous while compounds are homogenous mixtures. ✓ 01

Eutectic mixtures composition varies with pressure while compounds composition doesn't vary with pressure

Eutectic mixtures separated by physical means.

ii. Similarity:

Have constant compositions at constant pressure.

Have cooling curves like pure metals. ✓ 01

Have sharp melting point at constant pressure.

12.(a) Define the term enthalpy of solution. (01 mark)

Enthalpy of solution is the enthalpy change that takes place when one mole of a solute dissolves in a specific amount of water until there is no further heat change. ✓ 01

b) In an experiment to determine the enthalpy of solution of anhydrous and hydrated copper (II) sulphate salts, 4.0g of anhydrous salt was added to 50g of water and temperature of water rose by 8.0°C . When 4.0g of the hydrated salt $[\text{CuSO}_4 \cdot 5\text{H}_2\text{O}]$ was added to 50g of water, the temperature of water dropped by 1.3°C . Calculate the enthalpy of solution in kJ/mol of: [Specific heat capacity of solution = $4.2\text{J/g}/^{\circ}\text{C}$]

i. Anhydrous copper (II) sulphate. (02½ marks)

$$\text{Heat evolved} = \text{mass of solution} \times S \cdot H \cdot C \times \Delta T \\ = 54 \times 4.2 \times 8 \approx 1814.4 \text{ J. } \checkmark$$

$$\text{R.F.M of } \text{CuSO}_4 = 64(1) + 32(1) + 16(4) = 160. \checkmark$$

$$\text{No of } \text{CuSO}_4 = \frac{4}{160} \approx 0.025. \checkmark$$

02½

0.025 mole of CuSO_4 produce 1,814.4J.

$$1 \text{ mole } " " " 1,814.4 \text{ J} / 0.025 \text{ moles} \\ = -72,576 \text{ J/mol. } \checkmark$$

ii. Hydrate copper (II) sulphate. (02 marks)

$$\text{Heat evolved} = \text{mass of solution} \times S \cdot H \cdot C \times \Delta T$$

$$= 54 \times 4.2 \times 1.3 \approx 294.84 \text{ J. } \checkmark$$

$$\text{R.F.M of } \text{CuSO}_4 \cdot 5\text{H}_2\text{O} = 64 + 32 + 16(4) + 5(18) = 250. \checkmark$$

$$\text{No of mole of } \text{CuSO}_4 \cdot 5\text{H}_2\text{O} = \frac{4}{250} = 0.016. \checkmark \quad 02$$

0.016 mole of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ liberate 294.84J.

$$1 " " " " " 294.84 \text{ J} / 0.016 \text{ mole. } \checkmark$$

iii. Molar enthalpy of solution = +18.4275 KJ/mol. \checkmark

Comment on the difference in values of enthalpy of solution = +18.427.5J.

(02 marks)

Anhydrous copper (II) sulphate is more \checkmark
soluble ^{in water} than hydrated copper (II) sulphate.

This is because enthalpy of solution of anhydrous copper (II) sulphate is exothermic [−ve] implying that hydration energy ^{out} weighs ~~out~~ lattice energy hence the reaction releases enough amount of energy to separate the ions in the salt.

- c) Calculate the enthalpy change for the reaction:

02

Mathematically:

$$\Delta H_{\text{solution of CuSO}_4} = \text{Hydration energy of CuSO}_4 + \Delta H_{\text{solution of CuSO}_4 \cdot 5\text{H}_2\text{O}}$$

$$-72.576 = \text{Enthalpy of hydration} + 18.4275 \quad \checkmark$$

$$\text{Enthalpy of hydration of CuSO}_4 = -91.0035 \text{ kJ/mol} \quad \checkmark$$

13. Nitrogen and hydrogen react to form ammonia according to

- a) State the industrial conditions used to obtain a maximum yield of ammonia gas. (01½ marks)

Temperature of about 450–550°C. ~~✓~~
 Pressure range of 200–500 atm. ~~✓~~
 Finely divided iron catalyst. ~~✓~~

01½

b) During the manufacture of nitric acid, ammonia is catalytically oxidized to P which is further oxidized to Q. Q is then reacted with water to produce nitric acid.

i. Name P and Q.

P = *Nitrogen monoxide* ✓ (@0½ mark)

Q = *Nitrogen dioxide* ✓ 01

ii. Write equations for the formation of: (@01½ marks)

P:

Q:

c) Write equations for the reaction of concentrated nitric acid

and:

(@01½ marks)

i. Carbon.

ii. Copper.

14. Write equations to show how the following compounds can be synthesized.

a) Butanone from calcium carbide.

(03½ marks)

b) Phenylmethanol from benzene.

c) But-2-yne from ethyne.

15.(a) The saturated vapour pressures of liquids A & B which form an ideal solution at 20°C are 15kN/m² and 35kN/m² respectively. If the total pressure above the solution is 29kN/m², Calculate the:

- i. Mole fraction of A in the liquid mixture. (02 marks)

$$P_t = P_A + P_B; \text{ But } P_A = X_A P_A^0, P_B = X_B P_B^0$$

∴

$$P_t = X_A P_A^0 + X_B P_B^0; \text{ Also: } X_A + X_B = 1$$

$$\text{Hence: } X_B = 1 - X_A \quad \checkmark$$

$$P_t = X_A P_A^0 + (1 - X_A) P_B^0 \Rightarrow 29 = X_A (15) + (1 - X_A) 35$$

$$29 = 15X_A - 35X_A + 35 \Rightarrow 29 - 35 = [15 - 35]X_A \quad \underline{02}$$

$$\text{Mole fraction of A, } X_A = 0.3 \quad \checkmark$$

- ii. Composition of the vapour above the liquid mixture of A and B.

$$P_A = X_A P_A^0 \Rightarrow P_A = 0.3 (15) \Rightarrow P_A = 4.5 \text{ kN/m}^2. \quad \underline{02}$$

$$P_B = (1 - X_A) P_B^0 \Rightarrow P_B = (1 - 0.3) 35 \Rightarrow P_B = 24.5 \text{ kN/m}^2. \quad \checkmark$$

02

$$\text{Vapour composition of A} = \frac{4.5}{29} \approx 0.155. \quad \checkmark$$

$$\text{Vapour composition of B} = \frac{24.5}{29} \approx 0.845. \quad \checkmark$$

- b) The boiling point-composition diagram for a mixture of hydrochloric acid and water is shown below:
(Diagram needed)

- i. State how the mixture deviates from Raoult's law. Give a reason for your answer. (02 marks)

Negatively ✓ Because at maximum point,
it shows that liquid boils off giving a
vapour of the same composition ✓
as a pure liquid known as Azeotrope. ✓

02

- ii. Explain the causes of the deviation you have stated in b (i)
above.

The Hydrochloric acid ionises ✓ in water producing
hydrogen, H^+ and chloride, Cl^- ions. The forces of
attraction between ions and water molecules D3
are stronger ✓ than individual water and HCl acid
molecules - since ions are hydrated ✓ with strong
ion-dipole ✓ attraction hence reduces ✓ the escaping
tendency of molecules into vapour state. ✓

- 16.(a) An organic compound, P has a molecular formula C_4H_9Br .

- i. Name the functional group in organic compound, P. (01 mark)

Carbon-bromine bond. ✓

01

- ii. Write the structural formulae and names of all possible
isomers of organic compound, P. (04 marks)

$CH_3 CH_2 CH_2 CH_2 Br$; 1-bromobutane. ✓

$CH_3 CH_2 CH(Br) CH_3$; 2-bromobutane. ✓

CH_3
 $CH_3 - C - CH_3$; 2-bromo-2-methylpropane. ✓

Page | 18

04

CH_3 CH $CH_2 Br$; 1-bromo-2-methylpropane ✓

CH_3

iii. Identify two isomers in a (ii) that when reacted with hot ethanolic potassium hydroxide solution give the same product.

iv. Write the structural formula and name of the product in a (iii).

b) Outline the mechanism for the reaction between the product in a (iii) and benzene in presence of an acid. (02 marks)

17. The table below shows values for the atomic and ionic radii of the alkali metals.

Element	Atomic radius [$\times 10^{-10}\text{m}$]	Ionic radius [$\times 10^{-10}\text{m}$]
Lithium	1.23	0.68
Sodium	1.57	0.97
Potassium	2.03	1.33
Rubidium	2.16	1.47
Caesium	2.35	1.67

a) In every case, the radius of an ion is smaller than that of the corresponding atom. Explain. (02 marks)

The ions are formed by losing electrons; when electrons are lost, Proton's numbers becomes greater than the remaining few electrons as screening effect reduces resulting to an increase in effective nuclear charge hence the remaining few electrons become more strongly attracted by the nucleus than repelled. 02

- b) Explain the increase in atomic radius along the series lithium to Caesium.

Atomic radius increases from Lithium to Caesium due to increase in both nuclear charge and shielding effect; however, the increase in screening effect outweighs that of nuclear charge since an extra-orbital completely filled with electrons are added as effective nuclear charge decreases; and outermost electrons are far and weakly attracted by the nucleus. 02

- c) The ions Na^+ , Mg^{2+} & Al^{3+} have the same electronic configuration, yet they have different ionic radii. Suggest a reason for this.

(02 marks)

The ions are formed by losing electrons; reducing the screening effect as proton's numbers remains unaffected. Hence effective nuclear charge increases in the order of charge Na^+ ; Mg^{2+} and Al^{3+} . Since proton's numbers increases in the order as ionic radius decreases of $\text{Na}^+ > \text{Mg}^{2+} > \text{Al}^{3+}$.

02

- d) Which of the alkali metal ions in the gaseous state is likely to have the highest hydration energy? Give a reason. (03 marks)

Aluminium Al^{3+} ion because it has smaller ionic radius with high charge hence high charge density and polarising power. Therefore it attract water molecules strongly to become more hydrated with more amount of energy.

03
